

# POLISHING MACHINE

PB series polishing machines are composed of two symmetrical bodies. One of them polishes the blade, whereas the other one does a second polishing. The transfer, where the workpieces to be polished are fixed, is located between both bodies.

The speeds are determined by a simple programming process, as well as the times when the polishing paste is dispensed to the rollers.

	PB
Diameter of polishing discs (mm)	300
Polishing area length (mm)	1000
Installed power (Kw)	50
Number of workpiece holders in the transfer	10
Approximate weight (Kg)	4000
